

QA Automation Capstone: Project Presentation

Welcome to the Capstone Project Presentation. This document provides a simple overview of the testing strategy, the website being tested, and the main goals of this project.

1. The Website: MockMart E-Commerce

A Custom Testing Environment

For this project, we are testing a custom-built e-commerce website called MockMart. Instead of testing a public website that might change unexpectedly, building our own site gives us a stable and controlled environment.

What exactly is being tested?

The testing focuses on the everyday experience of an online shopper:

- Can a user successfully log in and log out?
- Do items stay in the shopping cart?
- Does the website look correct on different screen sizes?
- Do forms show the right error messages when a user types something wrong?

2. Project Goals

The main purpose of this capstone is to demonstrate a complete and organized software testing process.

- **Thorough Coverage:** Execute a total of 120 test cases to make sure the core shopping features work as expected.
- **Organization:** Keep the test steps and test data neatly separated so they are easy to read and update.
- **Bug Prevention:** Proactively find layout issues, broken links, and checkout errors before a real customer experiences them.

3. Areas of Testing (The 8 Modules)

The website is divided into 8 distinct areas. We will test each area to make sure the entire platform functions smoothly from start to finish.

1. **Authentication:** Registering new accounts and logging in safely.
2. **Product:** Viewing the product catalog, searching, and checking prices.
3. **Cart:** Adding items, removing items, and calculating the final price.
4. **Address/Shipping:** Entering delivery details and validating zip codes.
5. **User Profile:** Updating personal account information and changing passwords.

6. **Customer Support:** Submitting the "Contact Us" form correctly.
7. **Internal Communications:** Ensuring the website talks to its database correctly behind the scenes.
8. **Payment:** Checking that credit card forms require the correct number formats.

4. Test Case Breakdown

To ensure we test the website evenly, the workload is perfectly balanced across all 8 areas.

- **Total Test Cases:** 120
- **Test Cases per Area:** 15

For each area, the 15 tests are divided into three types of scenarios:

- **Normal Use:** Testing what happens when a user does everything right (e.g., entering a correct password).
- **Incorrect Use:** Testing what happens when a user makes a mistake (e.g., leaving a required field blank).
- **Extreme Cases:** Testing the limits of the website (e.g., typing an unusually long address).

5. Conclusion

This Capstone Project represents a full Quality Assurance cycle. By using a custom e-commerce website and running a carefully planned suite of 120 tests, this project proves that we can thoroughly evaluate a platform and ensure it is reliable and user-friendly.
